

## MEDIA STAR CONFIGURATION

---

The following configuration parameters constitute the MEDIA STAR configuration parameters found in Power-Link. Check this document often as more features and options are sure to be added.

1. **STATION NUMBER:** This is the arbitrary number that has been allocated to this radio station for filing purposes. Since the output automation files from the Media Star are ##mmddy.TRF (where ## is the station number, mm is month, dd is the day, and yy is year) this number is needed so that only this station's files are visible and selectable when looking through a possible "common area" (which could have other stations' files as well) for files.
2. **CHARACTER(S) TO GO BEFORE NUMERIC CART NUMBERS?** Enter up to 3 characters to place in front of carts (if any are needed)
3. **UP TO A LENGTH OF ?** In the above placement of characters, how long can the cart grow to be. If the characters are configured to be ABC then the A will be placed first (based on how much room there is) then the B and then the C will be placed according to how much room is available.
4. **INCLUDE THE BLOCK#S FOUND IN THE PLAYLIST?** If there are BLOCK#s found in the exported playlist from Media Star, this is your control as to where or not you want to see them in the resultant playlist. If you are NOT running Prophet, you probably do NOT want to see these.
5. **PROMPT ON SPOT EVENTS WITH NO CART NUMBER?** If there are SPOT type events found in the exported playlist that have no cart number, do you want PL to stop and prompt the user allowing them a last chance to correct what may be an incorrect entry?
